[Back to Function Tips](#)

This is a handy formula to double-check your balance sheet with:

It is often easier to type in the TRUE and FALSE components first

`=IF(ROUND(C4,0)=ROUND(C6,0),"in balance","out of balance")`

You have to round both cell references....

The screenshot shows an Excel spreadsheet with the following data:

	A	B	C	E	F	G	H
1							
2							
3							
4	Total Assets		1000.8				
5							
6	Total Liabilities		999.4				
7							
8	Out of Balance						
9							
10		If and Round Function	Out of Balance				

Once you have done this, if you change c6 to 99.5, C10 will display In Balance.

Tip: Always test both the true and the false components. Just because one works - that doesn't mean the other does.
